For such a large simulation the purely statistical error bars are negligible on $\xi$ even for galaxies.
Large-scale structure at high redshift

Springel, Frenk & White 2006

Large-scale structure in the galaxy distribution evolves very little with redshift

It is as strong at $z=8.5$ as at $z=0$

• Large-scale structure in observable galaxy populations should fall off much less rapidly to high redshift than that in the dark matter

• While the dark matter distribution is more weakly clustered for WMAP3 than for WMAP1 parameters, z=0 galaxy halos are equally clustered in the two cases

• At high redshift objects of given mass are less abundant in the WMAP3 case, but they are more strongly clustered
