Serving the new Millennium

Simon White
Max Planck Institute for Astrophysics

Moore's Law for Cosmological N-body Simulations

Springel et al 2005

- Computers double their speed every 18 months
- Simulations double their size every 16.5 months
- A naive N-body force calculation needs N^2 op's
- Progress has been roughly equally due to hardware and to improved algorithms

Millennium Run Statistics

Springel et al 2005: The Virgo Consortium

- DM particle number: $N = 2160^3 = 10,077,696,000 \approx 10^{10}$
- Box size: $L = 500 \text{ Mpc/h}$, Softening: $\epsilon = 5 \text{ kpc/h} \longrightarrow L/\epsilon = 10^5$
- Initial redshift: $z_{\text{init}} = 127$
- Cosmology: $\Omega_{\text{tot}}=1$, $\Omega_{\text{m}}=0.25$, $\Omega_{\text{b}}=0.045$, $h=0.73$, $n=1$, $\sigma_8=0.9$
- 343,000 processor-hours on 512 nodes of an IBM Regatta
(28 machine days @ 0.2 Tflops using 1 Tbyte RAM)
- Full raw and reduced data stored at 64 redshifts
 \longrightarrow 27 Tbytes of stored data

A testbed for simulating the formation of $\sim 10^7$ galaxies

125 Mpc/h

$z = 0$ Dark Matter

Mass autocorrelation function

Springel et al 2005

For such a large simulation the purely statistical error bars are negligible on ξ

Halo Mass Functions in the MS

Springel et al 2005

Solid curves are the empirical fitting formula from Jenkins et al 2001 with no parameters adjusted

At $z = 0$ half of all mass is in lumps of $M > 2 \times 10^{10} M_{\odot}$

Goals for simulations of galaxy/AGN evolution

- Explore the physics of galaxy formation
- Understand the links between galaxy and SMBH formation
- Clarify why galaxy properties are related to clustering
- Determine how environment stimulates galaxy activity
- Interpret new multi-wavelength surveys of galaxies
- Check if such surveys can provide precision tests of and parameter estimates for the standard Λ CDM paradigm

Simulating galaxies /AGN in the Millennium Run

Springel et al 2005; Croton et al 2006, De Lucia et al 2006

- Build and store merger trees which encode the detailed assembly history of every $z=0$ halo *and* of the substructure within it
- Implement models for the formation/evolution of galaxies to follow
 - accretion, shock-heating and cooling of diffuse gas into disks
 - star formation from the ISM in disks
 - stellar evolution
 - SN feedback and stellar winds
 - chemical enrichment/dust formation
 - galaxy merging/morphological transformation

[After Springel et al (2001)
and De Lucia et al (2004)]
- Implement models for the growth of central black holes to follow
 - formation and growth from ISM gas during mergers
 - black hole mergers following galaxy mergers

[After Kauffmann
& Haehnelt (2000)]
- Include “radio mode” feedback from BH at cooling flow centres
 - energy feedback from BH in the central dominant galaxy depends on BH mass, gas temperature and gas mass fraction $\propto f_{\text{gas}} m_{\text{BH}} T^{1.5}$

125 Mpc/h

$z = 0$ Dark Matter

$z = 0$ Galaxy Light

Springel, Frenk &
White 2006

Galaxy autocorrelation function

Springel et al 2005

For such a large simulation the purely statistical error bars are negligible on ξ even for **galaxies**

Large-scale structure at high redshift

Springel, Frenk & White 2006

Large-scale structure in the galaxy distribution evolves very little with redshift

It is as strong at $z=8.5$ as at $z=0$

Evolution of mass and galaxy correlations

Springel, Frenk & White 2006

Effect of feedback on the Luminosity Function

Full model with reionisation, AGN and SN feedback

Croton et al 2006

Effect of feedback on the Luminosity Function

Full model with ~~reionisation~~, AGN and SN feedback

Croton et al 2006

Effect of feedback on the Luminosity Function

Full model with ~~reionisation~~, ~~AGN~~ and SN feedback

Croton et al 2006

Effect of feedback on the Luminosity Function

Full model with ~~reionisation~~, ~~AGN~~ and ~~SN~~ feedback

Croton et al 2006

Effect of feedback on the Luminosity Function

Full model with reionisation, AGN and SN feedback Croton et al 2006

The effects of “radio mode” feedback on $z=0$ galaxies

Croton et al 2006

- In the absence of a “cure” for the cooling flow problem, the most massive galaxies are:
 - too bright
 - too blue
 - disk-dominated
- With cooling flows suppressed by “radio AGN” these galaxies are
 - less massive
 - red
 - elliptical

Issues for public release of Millennium data

- Data Volume

Raw data ---- 64 snapshots ---- 20 Tbytes

Halo data ---- 7.5×10^8 halos/subhalos ---- 300 Gbyte database

Galaxy data ---- 10^9 galaxies ---- 1 Tbyte database *per model*

- Complexity of data relations

Spatial relations ---- real space, redshift space....

Temporal relations ---- many to one forwards in time

Variety of attributes ---- M_* , age, L, B-V, B/T, V_{rot}

Linking data of different type -- (sub)halos — galaxies
halos/galaxies — mass
galaxies — shear field
lightcone — snapshot

- Ease of use for non-specialists

Good documentation

Widely known, 'simple' and powerful search engine

Documentation

1. Introduction

- 1.1 Simulation
- 1.2 Semi-analytical galaxy formation
- 1.3 Science questions
- 1.4 Storing merger trees
- 1.5 Peano-Hilbert spatial indexing
- 1.6 Links

2. Relational databases and SQL

3. Tables

Help

Maximum number of rows to return to the query form:

Previous queries :

Halo 1

Galaxy 1

Find halos/galaxies at a given redshift (SNAPNUM) within a certain part of the simulation volume (X,Y,Z).

Halo 2

Find the whole progenitor tree, in depth-first order, of a halo identified by its id (I_HALO)

Halo 3

Find the progenitors at a given redshift (SNAPNUM) of all halos of mass (N_P) greater than 4000 at a later redshift (SNAPNUM). The progenitors are limited to have mass >= 100.

Halo 4

Find all the halos of mass (N_P) >= 1000 that have just had a major merger, defined by having at least two progenitors of mass >= 0.2*descendant mass.

Halo 5

Galaxy 5

Find the mass/luminosity function of halos/galaxies at z=0 using logarithmic intervals.

Galaxy 6

Find the Tully-Fisher relation, $\text{Mag}_b/v_{\text{HI}}/k$ vs V_{vir} for galaxies with bulge/total mass ratio < 0.1. Subsample by about 1% (RANDOM between 20000 and 30000).

Does halo clustering depend on formation history?

Gao, Springel & White 2005

The 20% of halos
with the *lowest*
formation redshifts in
a 30 Mpc/h thick slice

$$M_{\text{halo}} \sim 10^{11} M_{\odot}$$

Does halo clustering depend on formation history?

Gao, Springel & White 2005

The 20% of halos with the *highest* formation redshifts in a 30 Mpc/h thick slice

$$M_{\text{halo}} \sim 10^{11} M_{\odot}$$

Does halo clustering depend on formation history?

Gao, Springel & White 2005

An equal number of
randomly chosen DM
particles

Halo bias as a function of mass and formation time

Gao, Springel & White 2005

- Bias increases smoothly with formation redshift

- The dependence on formation redshift is strongest at low mass
- This dependence is consistent *neither* with excursion set theory *nor* with HOD models

Halo bias as a function of mass and formation time

Gao & White 2006

Halo bias as a function of mass and concentration

Gao & White 2006

Halo bias as a function of mass and substructure

Gao & White 2006

Halo bias as a function of mass and substructure

Gao & White 2006

Halo bias as a function of mass and spin

Gao & White 2006
